Humans are biologically adapted to cultural environments they themselves create. Human brain and mind are therefore modified, shaped, and formed through one's active engagement in a variety of sociocultural contexts. Understanding the interplay between culture and human brain function and between culture and human behaviour is a necessary step for uncovering both the mechanisms underlying cultural processes and behaviour and human brain responses to evolutionary/societal demands.

Our brains probably became modern before our culture. For 200,000–300,000 years after Homo sapiens first appeared, tools and artefacts remained surprisingly simple, little better than Neanderthal technology and simpler than those of modern hunter-gatherers such as certain indigenous Americans.

Both the structure and function of the human brain throughout its development are shaped by the environment. The social environment, in turn, is shaped by culture. The emerging field of cultural neuroscience examines how the interplay and mutual constitution between neural and cultural forces gives rise to different patterns of behavior, perception, and cognition.

The advantages of using adult human brain cells as tools to study human brain function from both historical and future perspectives are discussed. In particular, studies using dissociated cultures of adult human microglia, astrocytes, oligodendrocytes and neurons are described and the applications of these types of study are evaluated. Alternative sources of human brain cells such as adult neural stem cells, induced pluripotent stem cells and slice cultures of adult human brain tissue are ...

By early adulthood, the neuroplasticity of the brain is greatly reduced, and this leads to a fundamental shift in the relationship between the individual and the environment: during the first part of life, the brain and mind shape themselves to the major recurring features of their environment; by early adulthood, the individual attempts to make the environment conform to the established internal structures of the brain and mind. In Brain and Culture, Bruce Wexler explores the social ...

Overview. Neuroanthropology explores how the brain gives rise to culture, how culture influences brain development, structure and function, and the pathways followed by the co-evolution of brain and culture. Moreover, neuroanthropologists consider how new findings in the brain sciences help us understand the interactive effects of culture and biology on human development and behavior.

Neural organoids, also known as cerebral organoids, are hPSC-derived three-dimensional in vitro culture systems that recapitulate the developmental processes and organization of the developing human brain. These 'mini-brains' provide a physiologically relevant in vitro 3D brain model for the study of neurological development and disease processes that are unique to the human nervous system.

Human evolution, the process by which human beings developed on Earth from now-extinct primates.Viewed zoologically, we humans are Homo sapiens, a culture-bearing upright-walking species that lives on the ground and very likely first evolved in Africa about 315,000 years ago. We are now the only living members of what many zoologists refer to as the human tribe, Hominini, but there is abundant ...
